

CFPrototype.

This document explains how to install and use CFPrototype. Please feel free to contact me at qasimrasheed@gmail.com if you have any questions.

See the License for the specific language governing permissions and limitations under the License.

Pre-requisites:

1. ColdFusion MX 7 (It might work on CFMX 6.1 although I haven't tested it.
2. Fusebox framework (version 5.5.1) (www.fusebox.com)
3. Javascript Prototype Library (1.6.0.2) (www.prototypejs.org)

Installation

Database:

SQL scripts for creating required tables are included with the distribution zip under install folder. There are scripts for mySQL, SQL Server and Oracle. I believe it will be quite trivial to modify those for other RDBMS.

Application:

Please extract the provided zip in a folder under your webroot or a web accessible folder.

Configuration:

Please refer to index.cfm in the root for few initial configurations.

Running CFPrototype:

If you have followed the installation instruction, CFPrototype should be ready to use and you can browse to the site using your favorite browser to:

<http://~yourservername~/cfprototype> (assuming that you have unzipped it under cfprototype folder)

You will be prompted to login. For starter that default username is 'admin' with password 'password'. You will want to change this immediately of course.
